## KEY\_Practice12\_Pandas-Subsetting-I

May 28, 2020

## 1 Practice: Subsetting Pandas DataFrames I

For this practice, let's use the iris dataset:

```
[1]: # import the pandas package
import pandas as pd
# set the path
path = 'https://raw.githubusercontent.com/GWC-DCMB/ClubCurriculum/master/'
# this is where the file is located
filename = path + 'SampleData/iris.csv'
# load the iris dataset into a DataFrame
iris = pd.read_csv(filename)
```

Get familiar with the dataset:

```
[2]: # take a look at the beginning iris.head()
```

```
[2]:
       sepal_length sepal_width petal_length petal_width species
                 5.1
                              3.5
                                            1.4
                                                         0.2 setosa
                 4.9
                              3.0
                                            1.4
                                                         0.2 setosa
     1
     2
                4.7
                              3.2
                                            1.3
                                                         0.2 setosa
     3
                 4.6
                              3.1
                                            1.5
                                                         0.2 setosa
                5.0
     4
                              3.6
                                            1.4
                                                         0.2 setosa
```

Try subsetting on columns:

```
[3]: # subset the species column

iris['species']
```

                               3.4
                                             1.7
                                                           0.2 setosa
[9]: # select row 30
     iris.iloc[30]
```

[6]: # select the first 10 rows

**Bonus:** Do you think it's possible to subset with both rows AND columns at the same time? Why or why not?

Feel free to experiment in the space below:

[]:
